

DIPARTIMENTO DI STRUTTURE PER L'INGEGNERIA E L'ARCHITETTURA
CORSO DI DOTTORATO DI RICERCA IN
INGEGNERIA STRUTTURALE GEOTECNICA E RISCHIO SISMICO

XXXVI CICLO

Il sottoscritto prof. **Emilio BIOTTA**

(PO PA **X** RU RTD) afferente al **Dipartimento di Ingegneria Civile, Edile e Ambientale (DICEA) S.S.D. ICAR/07 – Geotecnica**)

CHIEDE

di essere inserito tra i possibili tutor di studenti di dottorato per il XXXVI ciclo.

1. Curriculum sintetico del proponente (max 500 parole)

Born in 1975

Education

- **2004:** PhD in Geotechnical Engineering, University Sapienza of Rome (Italy)
- **1999:** 5-year **Master Degree** (Laurea) in Civil Engineering (marks: 110/110 cum laude), University of Napoli Federico II (Italy)
-

Current academic position

- **2016 to date:** Associate Professor (Geotechnical Engineering) at University of Napoli Federico II

Career

- 2017, Dec** **National Scientific Qualification** (ASN) for recruitment in a position of full professor
- 2016, Nov** **Visiting Scholar** at Department of Geotechnical and Tunnel Engineering of Shanghai Tongji University (China)
- 2010-2016** **Tenured Researcher and Adjunct Professor** at University of Napoli Federico II
- 2008-2010** **Research Associate** at Dept. of Hydraulic, Geotechnical and Environmental Engineering - University of Napoli Federico II
- 2007** **Researcher** at CMCC (Euro-Mediterranean Centre for Climate Changes) of Lecce
- 2006** **Visiting Research Fellow** at School of Engineering and Mathematical Sciences, City University London (UK)
- 2004-2006** **Post-Doctoral Scholar** at Dept. of Geotechnical Engineering - University of Napoli Federico II
- 2002** **Visiting Research Student** at the Geotechnical Engineering Research Centre, City University London (UK)
- 2000-2003** **PhD Student** in Geotechnical Engineering, University Sapienza of Rome
- 2000** **Research Trainee** at INP (Institut National Polytechnique), Grenoble, France.

DIPARTIMENTO DI STRUTTURE PER L'INGEGNERIA E L'ARCHITETTURA
CORSO DI DOTTORATO DI RICERCA IN
INGEGNERIA STRUTTURALE GEOTECNICA E RISCHIO SISMICO

Teaching:

- **Soil mechanics** (undergraduate)
- **Tunnels and underground structures** (post-graduate).

Research (main topics):

- **Tunnels in urban areas**
- **Ground improvement for mitigation against soil liquefaction**
- **Ground improvement for seismic isolation of buildings and infrastructures**
- **Geotechnical engineering for the preservation of monument and historic sites**

Co-author of more than 120 scientific papers, 35 of them on indexed international Journals (ORCID 0000-0002-3185-2738).

Editorial Board Member of *Rivista Italiana di Geotecnica*, *Gallerie* and *Frontiers in Built Environment*

Guest Editor of a special issue of *Acta Geotechnica* (Aug 2014);

Co-editor of the Proceedings of International Symposium *Geotechnical Engineering for the Preservation of Monuments and Historic Sites*, Balkema

Co-editor of the volume *Geotechnics and Heritage*, Balkema

Member of the **Scientific Committee** of the *Handbook on Tunnels and Underground Works* (3 volumes, to be published in 2021-22)

Member of **Italian Geotechnical Association (AGI)** and **International Society of Soil Mechanics and Geotechnical Engineering (ISSMGE)**

Member of **Società Italiana Gallerie (SIG)**

Italian delegate of **Technical Committees TC 104 (Physical Modelling)** and **TC 219 (System Performance of Geotechnical Structures)** of the ISSMGE

Member of the **European Commitment on Raw Materials “ROSE - Recycling of secondary raw materials for a sustainable optimization of construction processes in civil engineering works”**, (<https://ec.europa.eu/eip/raw-materials/en/commitment-detail/344>)

Activities of research-academia-business cooperation and knowledge transfer

- **2020** co-founder of the Academic Spin-off and Start-up *Smart-G - innovative solutions in ground improvement and geotechnical engineering* (www.smart-g.eu)
- **2018** patent for industrial invention "Procedure to limit the propagation of vibrations in the ground" at the Italian Ministry of Economic Development (No. 102016000044134).
- **2016-2019** European H2020-LIQUEFACT RIA project (GA no. 700748) (budget UNINA approx. 600 k€), www.liquefact.eu.
- **2015-16** knowledge transfer project "TICISI - Columnary Treatments for Seismic and Hydraulic Insulation" (industrial partner: Tecno-IN SpA) within the POR Campania funding scheme, DICEA budget approx. 150 k€).
- **2013-2016** National Research and Competitiveness project METRICS (*Methods and Technologies for the management and re-qualification of Historic Centers and prestigious buildings*), coordinated by the industrial partner Stress s.c.ar.l. DICEA budget approx. 150 k€).

3. Titolo della ricerca proposta

Soil-structure interaction on liquefiable soils and effects on built environment

4. Area tematica

Ingegneria Geotecnica

Ingegneria Strutturale

Rischio Sismico

**DIPARTIMENTO DI STRUTTURE PER L'INGEGNERIA E L'ARCHITETTURA
CORSO DI DOTTORATO DI RICERCA IN
INGEGNERIA STRUTTURALE GEOTECNICA E RISCHIO SISMICO**

5. Sintesi del progetto di ricerca (max 500 parole. Stato dell'arte, obiettivi e breve programma previsto per le attività e)

The research deals with the soil-structure interaction between a liquefiable ground and buildings, focusing not only on liquefaction triggering, but on the anteceding pore pressure build-up during shaking and possible critical mechanisms (i.e. loss of bearing capacity, excessive settlement...) that may arise as its consequence.

Although several numerical studies have been carried out on such a topic (e.g. Shahir and Pak, 2010; Karamitros et al., 2013; Ayoubi & Pak, 2017), only a few experimental evidences are available to validate the numerical results, most of them from reduced scale models in centrifuge (e.g. Karimi and Dashti, 2016; Hughes and Madabhushi, 2019), due to the lack of complete datasets from real cases.

Previous studies have also shown that proximity among buildings in urban areas can affect ground motions, hence pore pressure build-up, induced settlement and potential damage (e.g. Jafarian et al., 2017). Hence the need to better understand building-soil-building interaction in liquefiable ground and the relevant controlling parameters. This would enable new strategies of ground improvement design thus contributing to the resilience of urban environment against earthquake-induced soil liquefaction.

A common measurement of the level of pore pressure build-up is the excess pore pressure ratio, r_u , that may be predicted with simplified assessment procedures in free-field conditions. Such calculations enable a reliable assessment of the effective stresses in *free-field* during shaking. However, it is well known that beneath the building foundations different distributions of excess pore pressure, hence of r_u , may develop, due to the different stress level compared to the *free-field*. Therefore, predicting the associated settlements and possible bearing capacity reduction from *free-field* r_u is not straightforward. Aim of the research is to verify if r_u can be a good predictor of the foundation settlement, before and after liquefaction occurs.

Both numerical and physical modelling will be adopted to investigate the problem, following the same approach already adopted in previous research projects (Fig. 1).

Two centrifuge tests will be carried out on a reduced scale model of a building founded on shallow foundation, with the aim of measuring the excess pore pressures that develop in the ground as well as the ground and building settlements during a seismic shaking. A first test will be carried out with a single building, while in a second the presence of adjacent building will be simulated. The dynamic response of the soil layer and of the building will be also measured, in terms of acceleration time histories and spectra. The results will be used to calibrate the numerical models through which the study will be expanded to different conditions.

INGEGNERIA STRUTTURALE GEOTECNICA E RISCHIO SISMICO**

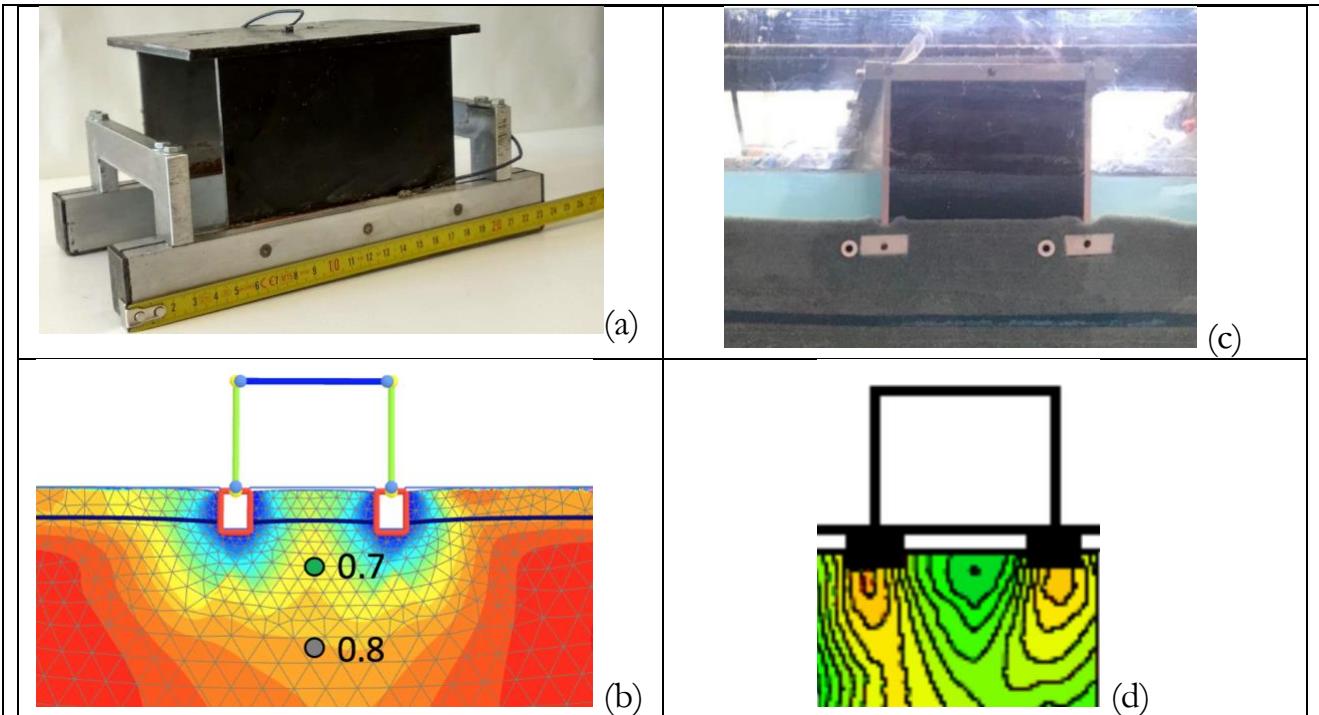

Figure 1 Reduced scale models of building in liquefiable soil: (a) building model in centrifuge tests of LIQUEFACT project; (b) numerical results vs. centrifuge measurements of excess pore pressure ratio in a LIQUEFACT test; (c) building model in a centrifuge test of STILUS-SERA project; contours of ground displacements measured by Particle Image Velocimetry in a STILUS-SERA test

(a,b from Fasano, 2020; c,d from Bilotta et al. (2020))

The main objectives of the research will be pursued as follows.

- During the first year the PhD student will:
 - investigate the problem by numerical analysis: existing and significant case histories from literature will be analyzed;
 - identify the relevant influencing factors.
- During the second year, the student will:
 - plan the centrifuge tests to be carried out at the *Center for Infrastructure, Energy, and Space Testing* of the University of Boulder, Colorado (USA);
 - carry out the centrifuge tests. The layout of tests (in particular the ground conditions and the structural layout) will be defined based on the results achieved in the first year.
- During the third and last year, a set of numerical analyses will be carried out to:
 - validate the numerical models against the centrifuge tests;
 - extend the scope of the study, using the validated numerical models.

7. Eventuali progetti di ricerca finanziati in cui l'attività si inserisce

Al momento l'attività di ricerca non è finanziata da fondi esterni ma s'inquadra nell'ambito delle attività che il tutor ha in corso da alcuni anni sulla mitigazione del rischio liquefazione, condotta principalmente nell'ambito del progetto H2020 LIQUEFACT (700748 - *Assessment and mitigation of liquefaction potential across Europe: a holistic approach to protect structures/infrastructures for improved resilience to earthquake-induced liquefaction disasters*, da poco concluso) e del progetto STILUS, condotto nell'ambito della rete SERA-TA (730900 - *Seismology and Earthquake Engineering Research Infrastructure Alliance for Europe*).

**DIPARTIMENTO DI STRUTTURE PER L'INGEGNERIA E L'ARCHITETTURA
CORSO DI DOTTORATO DI RICERCA IN
INGEGNERIA STRUTTURALE GEOTECNICA E RISCHIO SISMICO**

8. Eventuali fondi disponibili a supporto dell'attività del dottorando (escluso finanziamento borse)

Il tutor è responsabile dell'accordo interdipartimentale tra il DICEA di Federico II e il *Center for Infrastructure, Energy, and Space Testing* (CIEST) di Boulder Colorado, nell'ambito del più ampio Accordo di Ateneo di Collaborazione scientifica tra l'Università del Colorado a Boulder (USA) e l'Università di Napoli Federico II.

Al fine di facilitare la mobilità del dottorando e dei tutor da e verso Boulder, Colorado s'intende fare richiesta di accesso a fondi di Ateneo che finanzino attività di ricerca nell'ambito di accordi di cooperazione internazionale.

9. Informazioni relative ad un periodo di ricerca all'estero (minimo tre mesi) previsto per il dottorando (*indicare Università/ente di ricerca e docente/ricercatore di riferimento con indirizzo mail*) (max 300 parole)

Le prove in centrifuga saranno svolte presso il *Center for Infrastructure, Energy, and Space Testing* dell'**Università di Boulder Colorado (USA)**. E' previsto un soggiorno di **3-4 mesi**. Il riferimento è:

Shideh Dashti
Associate Professor in Geotechnical Engineering & Geomechanics
e-mail: shideh.dashti@colorado.edu

Il *Center for Infrastructure, Energy, and Space Testing* (CIEST) è un gruppo di laboratori condivisi, aperti a studenti, docenti e visitatori, che fornisce un'infrastruttura sperimentale costituita da tre centrifughe geotecniche, attrezzature per dinamica strutturale e prove sui materiali.

Durante il suo soggiorno a Boulder, lo studente potrà condurre due prove in centrifuga su modello di edificio in terreno liquefacibile, in due diverse condizioni stratigrafiche, con il fine di misurare lo sviluppo di sovra-pressioni neutre e i sedimenti indotti a piano campagna e alla struttura durante lo scuotimento sismico. I risultati delle prove saranno utili a calibrare i modelli numerici sulla base dei quali il problema sarà esteso a condizioni diverse da quelle modellate in centrifuga.
